Subject: Application for the Position of Data Engineer — Ivan Konstantinov

Dear Hiring Team,

I am writing to apply for the Middle Data Engineer position at T-Bank. I am confident that my professional background, technical expertise, and commitment to continuous development align well with the engineering standards and data-driven culture your organisation is known for.

Over the past two years, I have worked as a Data Engineer at L'Oréal Russia & Kazakhstan, a subsidiary of one of the world's largest international consumer goods corporations. In this role, I have been responsible for the design, development, and maintenance of ETL pipelines across 30+ source systems using Informatica PowerCenter, as well as data modelling in MS SQL Server, SAP BW, and SSAS Tabular. Working within a complex enterprise environment has given me a strong appreciation for pipeline reliability, schema stability, and the downstream consequences of data quality failures.

Data quality has been a particular focus of my work. I independently designed and implemented a volume-tracking monitoring system in MS SQL Server that captures record counts at three sequential pipeline checkpoints — ingestion, ETL output, and warehouse load. This initiative transformed incident response from a reactive, stakeholder-reported process into a proactive engineering discipline, significantly reducing mean time to resolution for load discrepancies. I have similarly documented end-to-end enrichment pipelines with explicit DQ check matrices, historization strategies, and reload logic, establishing a documentation standard that the team continues to use.

I am actively expanding my expertise toward the modern data stack. Alongside my full-time engineering role, I am pursuing a Master's degree in Information Systems

at MIREA — Russian Technological University, with a focus on applied data analysis and organisational systems. In parallel, I am developing practical skills in Apache Airflow, dbt, and ClickHouse, technologies I consider central to scalable, maintainable data infrastructure in a high-throughput environment such as T-Bank.

T-Bank's reputation for engineering rigour, investment in data infrastructure, and the scale of its data challenges make it a compelling next step in my career. I am particularly motivated by the opportunity to apply data reliability principles in a financial context, where the accuracy and freshness of data have immediate, measurable business impact.

I would welcome the opportunity to discuss my experience and how I might contribute to your team. Please find my CV attached.

Yours sincerely,
Ivan Konstantinov
